***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 6,7 and 9-11 rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

3. Claims 5 and 8 state that the legs are disposed relative to each other in a "substantially closed" position. However, the legs being 180 to 270 degrees is not believed to be substantially closed since the gap of at least 90 degrees or a full 180 degrees is a large opening.

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

5. Claims 1-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hingorani et al. Pat. No. 6,276,109 taken together with Soyka, Jr. et al. Pat. No. 5,560,175.

6. Hingorani discloses a process of molding a rocker panel which is provided with a living hinge 60a, 60b in the cantilever platforms 40 so as to avoid the use of sliding cores when removing the rocker panel from the mold (col. 1, line 47- col. 2, line 4). Soyka teaches the molding of a trim for a vehicle with a hinged flange (col. 2 lines 57-

67) which is an improvement over the use of contact flanges causing difficult removal from the mold (col. 1, lines 34-51). It would have been obvious to a person of ordinary skill in the art to provide a hinged flange of the type taught by Soyka rather than the cantilever platform of Hingorani since both options reduce the complexity of removal from the injection mold. The terminal portions of the space congruent with the C-shape shown in Fig.2 of Soyka being disposed relative to each other at an angle of less than 180 degrees clearly depend upon the where the center origin of the angle is position relative to the configuration of the terminal portions, i.e. the center origin positioned further away from the terminal portions would produce a smaller angle than the center origin of the angle position in line with the terminal portions.
